Soybean Cyst Nematode (SCN) Egg Count Report: Grainly Farms

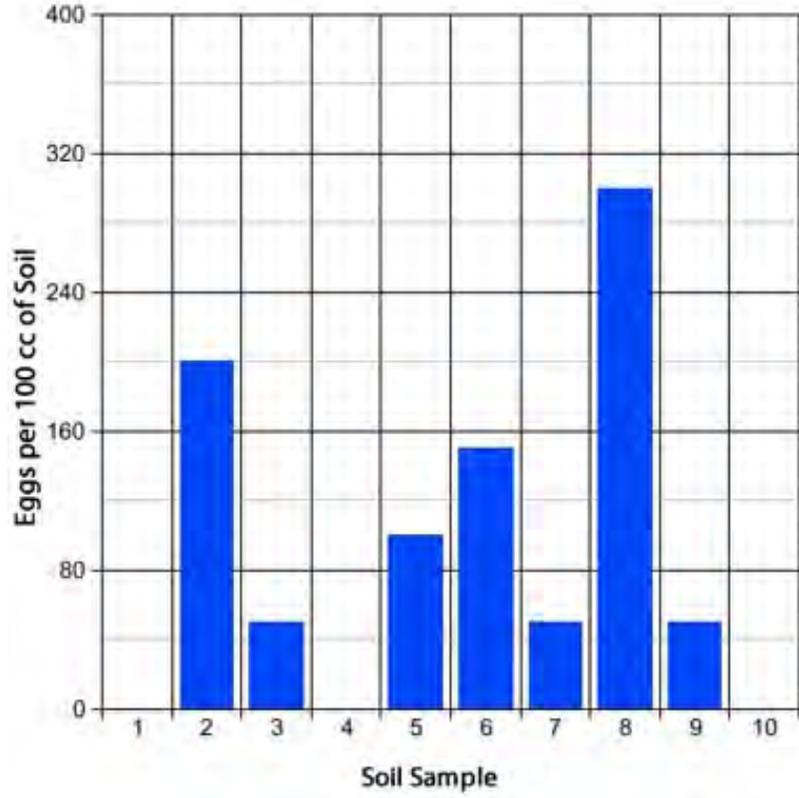

The data below represents soil samples taken from Grainly Farms. Several samples were taken from each field. The average number of soybean cyst nematode (SCN) eggs per 100 cubic centimeters (cc) of soil is represented in each graph.

Available soil moisture tests were completed at the time of SCN soil sampling. All samples fell between 75-100% available soil moisture. Mid Summer Field Conditions - Some of the soybeans in field three appear stunted and yellow, some spots in the field are showing signs that the soybeans will not survive to produce any beans.
